## **Starting Point**

So making a config.plist may seem hard, it's not. It just takes some time but this guide will tell you how to configure everything, you won't be left in the cold. This also means if you have issues, review your config settings to make sure they're correct. Main things to note with OpenCore:

- All properties must be defined, there are no default OpenCore will fall back on so do not delete sections unless told explicitly so. If the guide doesn't mention the option, leave it at default.
- The Sample.plist cannot be used As-Is, you must configure it to your system
- DO NOT USE CONFIGURATORS, these rarely respect OpenCore's configuration and even some like Mackie's will add Clover properties and corrupt plists!

Now with all that, a quick reminder of the tools we need

- ProperTree
  - Universal plist editor
- GenSMBIOS☆
  - For generating our SMBIOS data
- Sample/config.plist ☑
  - See previous section on how to obtain: config.plist Setup

## WARNING

Read this guide more than once before setting up OpenCore and make sure you have it set up correctly. Do note that images will not always be the most up-to-date so please read the text below them, if nothing's mentioned then leave as default.

# ACPI

Key	Туре	Value

> Platforminfo	a Dictionary	8 key/value pairs
> UEFI	* Dictionary	10 key/value pairs

#### Add

# Info

This is where you'll add SSDTs for your system, these are very important to **booting macOS** and have many uses like **USB maps** disabling unsupported GPUs and such. And with our system, it's even required to boot. Guide on making them found here: **Getting started with ACPI** 

For us we'll need a couple of SSDTs to bring back functionality that Clover provided:

SSDT-EC ☐ Fixes the embedded controller, see Getting Started With ACPI Guide ☐ for more details.

Note that you **should not** add your generated DSDT.aml here, it is already in your firmware. So if present, remove the entry for it in your config.plist and under EFI/OC/ACPI.

GitHub □

For those wanting a deeper dive into dumping your DSDT, how to make these SSDTs, and compiling them, please see the Getting started with ACPI page. Compiled SSDTs have a .aml extension(Assembled) and will go into the EFI/OC/ACPI folder and must be specified in your config under ACPI -> Add as well.

#### Delete

This blocks certain ACPI tables from loading, for us we can ignore this.

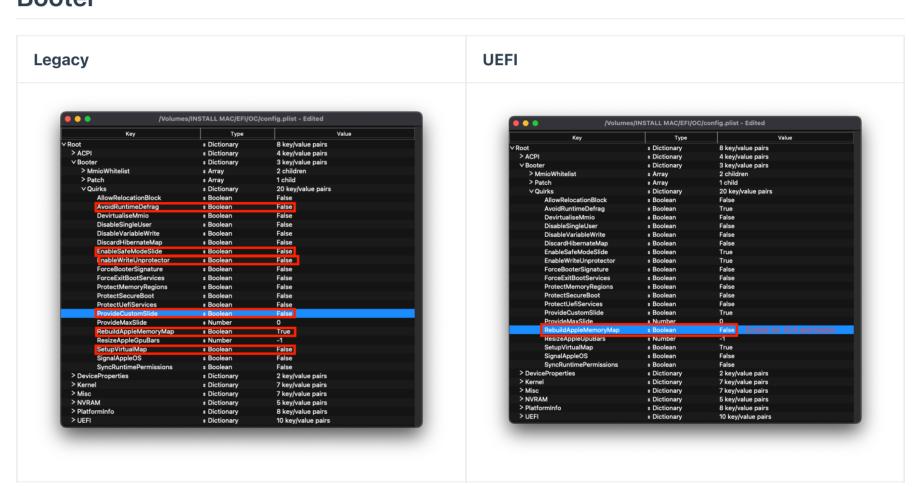

#### Patch

This section allows us to dynamically modify parts of the ACPI (DSDT, SSDT, etc.) via OpenCore. For us, our patches are handled by our SSDTs. This is a much cleaner solution as this will allow us to boot Windows and other OSes with OpenCore

#### Quirks

Settings relating to ACPI, leave everything here as default as we have no use for these quirks.

# **Booter**

This section is dedicated to quirks relating to boot.efi patching with OpenRuntime, the replacement for AptioMemoryFix.efi

## **MmioWhitelist**

This section is allowing spaces to be passthrough to macOS that are generally ignored, useful when paired with DevirtualiseMmio

#### Quirks

#### Info

Settings relating to boot.efi patching and firmware fixes, depending where your board has UEFI, you have 2 options depending what your motherboard supports:

## **Legacy Settings**

Quirk	Enabled	Comment
AvoidRuntimeDefrag	No	Big Sur may require this quirk enabled
EnableSafeModeSlide	No	
EnableWriteUnprotector	No	
ProvideCustomSlide	No	
RebuildAppleMemoryMap	Yes	This is required to boot OS X 10.4 through 10.6
SetupVirtualMap	No	

#### **UEFI Settings**

Quirk	Enabled	Comment
RebuildAppleMemoryMap	Yes	This is required to boot OS X 10.4 through 10.6

# **DeviceProperties**

GitHub ☐

#### Add

Sets device properties from a map.

By default, the Sample.plist has this section set for audio which we'll be setting up by setting the layout ID in the boot-args section, so removal of PciRoot(0x0)/Pci(0x1b,0x0) is also recommended from the Add section. On other platforms this section is also used for iGPU setup, on Penryn however it is covered in another guide .

#### **Delete**

Removes device properties from the map, for us we can ignore this

# Kernel

## Add

Here's where we specify which kexts to load, in what specific order to load, and what architectures each kext is meant for. By default we recommend leaving what ProperTree has done, however for 32-bit CPUs please see below: € OpenCore Install Guide
Switch theme

#### **Emulate**

Needed for spoofing unsupported CPUs like Pentiums and Celerons

• Cpuid1Mask: Leave this blank

• Cpuid1Data: Leave this blank

#### **Force**

Used for loading kexts off system volume, only relevant for older operating systems where certain kexts are not present in the cache(ie. IONetworkingFamily in 10.6).

GitHub □

For us, we can ignore.

#### **Block**

Blocks certain kexts from loading. Not relevant for us.

#### Patch

Patches both the kernel and kexts.

#### Quirks

#### Info

Settings relating to the kernel, for us we'll be enabling the following:

Quirk	Enabled	Comment
DisableloMapper	YES	Not needed if VT-D is disabled in the BIOS
LapicKernelPanic	NO	HP Machines will require this quirk
PanicNoKextDump	YES	Not required for 10.12 and older
PowerTimeoutKernelPanic	YES	Not required for 10.14 and older
XhciPortLimit	YES	Disable if running macOS 11.3+

Credits

-v	This enables verbose mode, which shows all the behind-the-scenes text that scrolls by as you're booting instead of the Apple logo and progress bar. It's invaluable to any Hackintosher, as it gives you an inside look at the boot process, and can help you identify issues, problem kexts, etc.
debug=0x100	This disables macOS's watchdog which helps prevents a reboot on a kernel panic. That way you can <i>hopefully</i> glean some useful info and follow the breadcrumbs to get past the issues.
keepsyms=1	This is a companion setting to debug=0x100 that tells the OS to also print the symbols on a kernel panic. That can give some more helpful insight as to what's causing the panic itself.
alcid=1	Used for setting layout-id for AppleALC, see supported codecs ☐ to figure out which layout to use for your specific system. More info on this is covered in the Post-Install Page ☐

#### • GPU-Specific boot-args:

boot-args	Description
agdpmod=pikera	Used for disabling board ID checks on some Navi GPUs (RX 5000 & 6000 series), without this you'll get a black screen. <b>Don't use if you don't have Navi</b> (ie. Polaris and Vega cards shouldn't use this)
-radcodec	Used for allowing officially unsupported AMD GPUs (spoofed) to use the Hardware Video Encoder
radpg=15	Used for disabling some power-gating modes, helpful for properly initializing AMD Cape Verde based GPUs
unfairgva=1	Used for fixing hardware DRM support on supported AMD GPUs
nvda_drv_vrl=1	Used for enabling NVIDIA's Web Drivers on Maxwell and Pascal cards in macOS Sierra and High Sierra

#### • csr-active-config: 00000000

- Settings for 'System Integrity Protection' (SIP). It is generally recommended to change this with csrutil via the recovery partition.
- csr-active-config by default is set to 00000000 which enables System Integrity Protection. You can choose a
  number of different values but overall we recommend keeping this enabled for best security practices. More
  info can be found in our troubleshooting page: Disabling SIP
- run-efi-updater: No
  - This is used to prevent Apple's firmware update packages from installing and breaking boot order; this is important as these firmware updates (meant for Macs) will not work.
- prev-lang:kbd: <>
  - Needed for non-latin keyboards in the format of lang-COUNTRY: keyboard, recommended to keep blank though you can specify it(**Default in Sample config is Russian**):
- American: en-US:0 ( 656e2d55533a30 in HEX)
- ∘ Full list can be found in AppleKeyboardLayouts.txt ☐
- Hint: prev-lang:kbd can be changed into a String so you can input en-US:0 directly instead of converting to HEX
- Hint 2: prev-lang:kbd can be set to a blank variable (eg. <> ) which will force the Language Picker to appear instead at first boot up.

Key	Туре	Value
prev-lang:kbd	String	en-US:0

#### **Delete**

#### Info

Forcibly rewrites NVRAM variables, do note that Add will not overwrite values already present in NVRAM so values like boot-args should be left alone. For us, we'll be changing the following:

Quirk	Enabled
WriteFlash	YES

Choosing the right SMBIOS

#### Misc

Supporting the guides

Credits

#### Info

For setting up the SMBIOS info, we'll use CorpNewt's GenSMBIOS ☐ application.

For this Penryn example, we'll chose the iMac10,1 SMBIOS - this is done intentionally for compatibility's sake. There are 4 main SMBIOS used for legacy hardware:

SMBIOS	Hardware	OS Support
iMac4,1	Yonah SMBIOS(32-bit)	10.4 to 10.6.8
iMac7,1	Conroe SMBIOS(64-Bit, SSE3)	10.4 to 10.11.6
iMac10,1	Penryn SMBIOS(64-Bit, SSE4)	10.6 to 10.13.6
MacPro6,1	Mojave and newer SMBIOS	10.9 to current

• If you plan to later run macOS 10.14, Mojave or newer, MacPro6,1 will be the recommended SMBIOS. However please note you will need telemetrap.kext ☐ to resolve install issues

Run GenSMBIOS, pick option 1 for downloading MacSerial and Option 3 for selecting out SMBIOS. This will give us an output similar to the following:

#### 

Type: iMac10,1
Serial: C02KCYZLDNCW
Board Serial: C02309301QXF2FRJC

SmUUID: A154B586-874B-4E57-A1FF-9D6E503E4580

The Type part gets copied to Generic -> SystemProductName.

The Serial part gets copied to Generic -> SystemSerialNumber.

The Board Serial part gets copied to Generic -> MLB.

The Smuuid part gets copied to Generic -> SystemUUID.

We set Generic -> ROM to either an Apple ROM (dumped from a real Mac), your NIC MAC address, or any random MAC address (could be just 6 random bytes, for this guide we'll use 11223300 0000. After install follow the Fixing iServices page on how to find your real MAC Address)

Reminder that you need an invalid serial! When inputting your serial number in Apple's Check Coverage Page , you should get a message such as "Unable to check coverage for this serial number."

Automatic: YES

• Generates PlatformInfo based on Generic section instead of DataHub, NVRAM, and SMBIOS sections

ForgeUefiSupport IgnoreInvalidFlexRatio ReleaseUsbOwnership ReloadOptionRoms RequestBootVarRouting	Boolean     Boolean     Boolean     Boolean     Boolean	True False True

## ConnectDrivers: YES

• Forces .efi drivers, change to NO will automatically connect added UEFI drivers. This can make booting slightly faster, but not all drivers connect themselves. E.g. certain file system drivers may not load.

## **Drivers**

Add your .efi drivers here.

Only drivers present here should be:

- HfsPlusLegacy.efi
- OpenRuntime.efi
- OpenUsbKbDxe.efi(If your firmware does not support UEFI)
  - ► More in-depth Info

## **APFS**

By default, OpenCore only loads APFS drivers from macOS Big Sur and newer. If you are booting macOS Catalina or earlier, you may need to set a new minimum version/date. Not setting this can result in OpenCore not finding your macOS partition!

macOS Sierra and earlier use HFS instead of APFS. You can skip this section if booting older versions of macOS.

#### **APFS Versions**

Both MinVersion and MinDate need to be set if changing the minimum version.

macOS Version	Min Version	Min Date
High Sierra ( 10.13.6 )	748077008000000	20180621
Mojave ( 10.14.6 )	945275007000000	20190820
Catalina ( 10.15.4 )	1412101001000000	20200306
No restriction	-1	-1

#### **Audio**

Related to AudioDxe settings, for us we'll be ignoring(leave as default). This is unrelated to audio support in macOS.

For further use of AudioDxe and the Audio section, please see the Post Install page: Add GUI and Boot-chime □

#### Input

#### Info

Related to boot.efi keyboard passthrough used for FileVault and Hotkey support, leave everything here as default besides:

Quirk	Value	Comment
KeySupport	NO	Enable if your BIOS supports UEFI

#### Output

Relating to OpenCore's visual output, leave everything here as default as we have no use for these quirks.

► More in-depth Info

## **ProtocolOverrides**

Mainly relevant for Virtual machines, legacy macs and FileVault users. See here for more details: Security and FileVault

#### Quirks

#### Info

Relating to quirks with the UEFI environment, for us we'll be changing the following:

Quirk	Enabled	Comment
IgnoreInvalidFlexRatio	NO	Enable this if you have a UEFI BIOS
UnblockFsConnect	NO	Needed mainly by HP motherboards

► More in-depth Info

# ReservedMemory

Used for exempting certain memory regions from OSes to use, mainly relevant for Sandy Bridge iGPUs or systems with faulty memory. Use of this quirk is not covered in this guide

# Cleaning up

And now you're ready to save and place it into your EFI under EFI/OC.

For those having booting issues, please make sure to read the **Troubleshooting section** first and if your questions are still unanswered we have plenty of resources at your disposal:

# **Intel BIOS settings**

• Note: Most of these options may not be present in your firmware, we recommend matching up as closely as possible but don't be too concerned if many of these options are not available in your BIOS

#### Disable

- Fast Boot
- Secure Boot
- Serial/COM Port
- Parallel Port
  VT-d (can be enabled if you set DisableIoMapper to YES)
- Compatibility Support Module (CSM) (Must be off in most cases, GPU errors/stalls like gIO are common when this option is enabled)
- Intel SGX
- Intel Platform Trust

#### Enable

• VT-x
